HELLO OS

A local-first prototype for inspectable agent workflows

OPEN SOURCE / MIT

PRESS KIT · OCTOBER 2026

What it is

HELLO OS is an open-source, local-first prototype for inspecting agent identity records, missions, memory, selected MCP interactions, and static Agent Machine Language (AML) graphs. A human-facing dashboard provides an observation and review surface.

Implemented in this prototype

- Ed25519-backed did:key identity records
- Prisma with SQLite persistence for supported local records
- Mission, memory, trace, and selected MCP workflows
- Static AML parser, validator, diagnostics, and intent graph
- Next.js app, Bun MCP service, Docker Compose setup

Clear boundaries

HELLO OS is not a production cloud service. There is no hosted model runtime, production authentication or tenant isolation, on-chain settlement, or microVM execution. AML source is never executed. Wallet values are internal records, not money.

Stack

Next.js · TypeScript · Prisma · SQLite · Bun MCP service

Concept image only. Agents, activity, balances, and metrics shown are synthetic; this is not live telemetry.

Feedback welcome

The project is open for technical feedback on local setup, API contracts, AML validation, and what evidence agent workflows should expose. No dedicated press email is configured; use GitHub Discussions or the public profile.

About the project

HELLO OS is an experimental project exploring inspectable agent identity, memory, missions, tool boundaries, and reviewable records. The repository includes local setup instructions, API and protocol documentation, selected tests, and an evidence-first roadmap. Feature status and known limits are documented in the repository README.
